

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

- A2
1. (Currently Amended) A data communication apparatus capable of connecting to a plurality of communication lines, comprising:
a specification unit for specifying a transmission destination; and
a transmission unit for transmitting a plurality of its own address data corresponding to each of the plurality of communication lines to the specified transmission destination.
 2. (Original) The data communication apparatus according to claim 1, wherein said transmission unit transmits the address data together with image data.
 3. (Currently Amended) The data communication apparatus according to claim 1, further comprising:
a receiving unit for receiving at least one of address data of another from a data communication apparatus at the transmission destination; and
a recording unit for recording the address data received by the receiving unit.
 4. (Original) The data communication apparatus according to claim 3, further comprising a controller for controlling use of received address data.
 5. (Original) A method of data communication comprising the steps of:
specifying a transmission destination; and
transmitting a plurality of its own address data corresponding to each of a plurality of communication lines to the specified transmission destination.

6. (Currently Amended) A data communication apparatus capable of connecting to a plurality of communication lines, comprising:

a receiving unit for receiving at least one [[of]] address data [[of]] from another data communication apparatus;

a recording unit for recording the address data received by the receiving unit; and

a transmission unit for transmitting ~~at least one~~ a plurality of its own address data to the ~~address recorded by the recording unit~~ other data communication apparatus.

A2 7. (Original) The data communication apparatus according to claim 6, wherein said own address data are corresponding to each of the plurality of communication lines.

8. (Original) The data communication apparatus according to claim 6, further comprising a controller for controlling use of recorded address data.

9. (Currently Amended) A method of data communication comprising the steps of:

receiving at least one [[of]] address data of another data communication apparatus; recording the received address data; and

transmitting its own address data to the recorded address.

10. (New) The data communication apparatus according to claim 1 further comprising a memory for storing the address data.

11. (New) The data communication apparatus according to claim 4, wherein the controller is adapted to search the recording unit for an address corresponding to the specified transmission destination.

12. (New) The data communication apparatus according to claim 11, wherein the controller is adapted to retrieve an address from the recording unit when an address corresponding to the specified transmission destination is found, and to prompt a user to

provide an address when an address corresponding to the specified transmission destination is not found.

13. (New) The data communication apparatus according to claim 4, wherein the recording unit is adapted to update previously recorded addresses with the received address data.

AJ
14. (New) The method of claim 5, further comprising:
receiving from the specified transmission destination address data corresponding to the address of at least two communication lines to which the specified transmission destination is connected; and
storing the received address data in a memory.

15. (New) The method of claim 5, further comprising:
obtaining an address of the specified transmission destination by retrieving from a memory a plurality of addresses corresponding to the specified transmission destination and selecting one of the retrieved plurality of addresses.

16. (New) A data communication device capable of being coupled to a plurality of communication lines, the data communication device comprising:
a first memory for storing a plurality of addresses at which the data communication device can be reached;
a communication controller for communicating with another data communication device over one of the plurality of communication lines, wherein the communication controller is adapted to send to the other data communication device the plurality of addresses.

17. (New) The data communication device according to claim 16, wherein the communication controller is further adapted to receive from the other data communication device a plurality of addresses at which the other data communication device can be reached.

18. (New) The data communication device according to claim 17, further comprising a second memory for storing the received addresses.

19. (New) The data communication device according to claim 18 further comprising:

AZ a user interface adapted to accept from a user an identification of another data communication device; and

a processor programmed to retrieve from the second memory a plurality of addresses for the user identified data communication device.

20. (New) A data communication apparatus, comprising:

a communication controller capable of coupling the data communication apparatus to a plurality of communication lines, there being an address associated with each communication line at which the data communication apparatus can be reached; and

a processor programmed to cause the communication controller to transmit data to another device over one of the plurality of communication lines, and to transmit the addresses associated with the plurality of communication lines to the other device over the one communication line.
